

Bugs Rule!

Insects go through many changes as they grow and develop. The term for these changes is called metamorphosis.

Among stinging insects such as bees, wasps and ants, only the females have stingers.

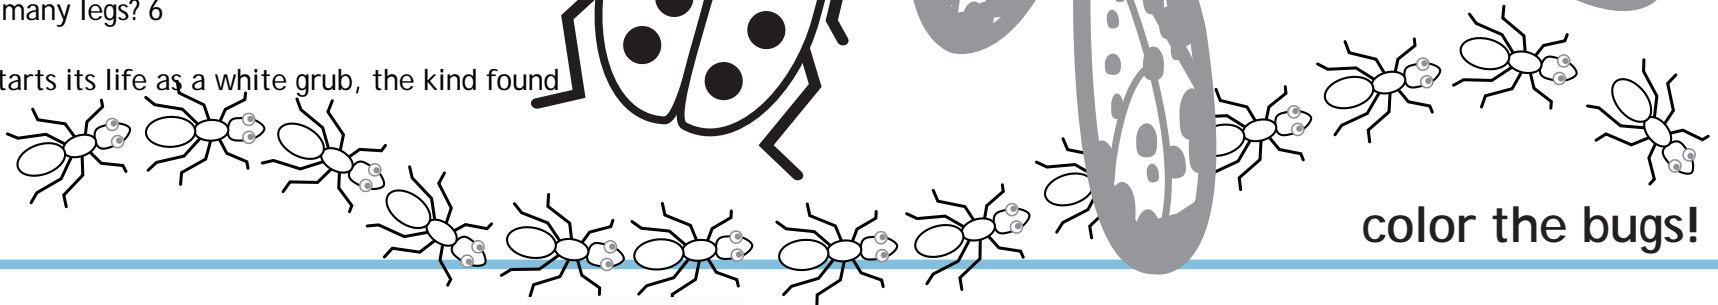

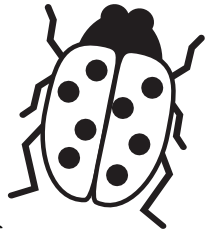

There are 750,000 species of insects in the world. That is more than all other animals and plants put together!

Ants are very strong and can carry objects many times their weight. If you were as strong as ant, you could carry a baby blue whale weighing 3 tons.

Some insects help the farmer with his crops and produce crops of their own. Honeybees pollinate flowers, live in hives and produce sweet syrup.

An insect has three body parts—the head, thorax and abdomen. How many legs? 6

A June beetle starts its life as a white grub, the kind found in your yard.

color the bugs!
